

SimplifiQ - AI Software Developer Intern Assessment

Thank you for your interest in SimplifiQ. We've reviewed your profile and would like to move forward with a short technical assignment. This assessment is designed to evaluate practical ability, problem-solving approach, and readiness to work in modern AI-driven software environments. We value clarity of thinking, execution capability, and responsible use of AI tools.

General Instructions

- You may use AI tools, documentation, and references.
- Your submission must reflect your understanding and engineering decisions.
- Clearly document assumptions, tradeoffs, and limitations.
- Focus on clarity, maintainability, and practicality.

Problem Statement

Many businesses, especially in sectors like finance, consulting, SaaS, and B2B services rely on lead intake forms to capture potential client information. However, the follow-up process is often manual: teams research the company, prepare personalized insights, create audit notes, and send outreach emails.

Your task is to build a working prototype that automates this entire workflow.

When a prospect submits a form containing their company details, the system should automatically:

- Capture and validate the submitted lead information
- Enrich the company data using publicly available sources, scraping or APIs
- Generate a personalized audit/report document in PDF format
- Send the generated report to the prospect via email
- Complete the entire workflow without human intervention

The goal is to create a system that delivers a very highly personalized and professional first interaction (super curated & align with their domain & work), demonstrating contextual understanding of the prospect's business immediately after form submission

What We'll Be Looking At

- **End-to-End Workflow**
We'll primarily evaluate how smoothly the complete automation flow works — from lead submission and data enrichment to report generation and email delivery. A functional and seamless workflow is the highest priority.

- **Report Quality & Personalization**

The generated report should feel professional, visually appealing, and personalized to the company submitted. We want the final output to create a strong first impression and clearly demonstrate meaningful research and insights.

- **System Design & Problem Solving**

We'll look at how thoughtfully the solution handles real-world scenarios such as missing data, failed API calls, scraping limitations, or incomplete company information. Clean logic and sensible fallbacks matter.

- **Code Quality & Documentation**

Well-structured, readable, and maintainable code is important. Clear setup instructions, architectural decisions, and concise documentation will help us understand your approach and thought process.

BONUS

Sheets Logging: Append each new lead's data (name, email, company, timestamp, report status) to a Google Sheet via the Sheets API. This acts as a live leads tracker.

PDF Archiving: Save a copy of the generated PDF to a Google Drive folder
